

Teacher Performance Assessment (edTPA)

All of us—teachers, teacher educators, parents, everyone who cares about schools and children—have a deep investment in the development of competent, highly skilled teachers with strong commitments to social justice and the education of all children. But we don't always agree on how to do that, or how to deal with teachers who don't fit those criteria. Recently some of those disagreements have come to a head around the growing use of the Teacher Performance Assessment (edTPA).

In summer 2010, *Rethinking Schools* published an article by Ann Berlak about the Performance Assessment for California Teachers (PACT). Berlak's article was critical of the PACT (see "Coming Soon to Your Favorite Teacher Credential Program: National Exit Exams") and it drew responses from both supporters and critics ("Letters," fall 2010). The PACT has since grown beyond California and is now spreading across the country as the edTPA.

The edTPA was developed by researchers and faculty at the Stanford Center for Assessment, Learning, and Equity, and is administered by Pearson. The edTPA consists of three segments (planning, teaching, and assessment) and requires substantial evidence, reflections, and videotaped classroom teaching. By 2012, the edTPA was being piloted in 22 states with an expectation of moving toward a national teacher licensure exam.

Rethinking Schools revisited the edTPA in our winter 2012–13 issue with a story about Barbara Madeloni and her students' resistance to the edTPA ("Stanford/Pearson Test for New Teachers Draws Fire"). Again, this story provoked responses from both supporters and critics. In light of the growing impact of the edTPA on teacher education and the range of opinions among teacher educators, *Rethinking Schools* invited three different perspectives for this special section: Linda Darling-Hammond and Maria E. Hyler offer their rationale in support of the edTPA, Barbara Madeloni and Julie Gorlewski provide a critique, and *Rethinking Schools* editor Wayne Au shares his experience with the edTPA and considers the test within the context of corporate education reform. ■

The Role of Performance Assessment in Developing Teaching as a Profession

BY LINDA DARLING-HAMMOND
AND MARIA E. HYLER

We are teachers who care deeply about the quality of our own teaching and the development of teaching as a profession. We write this from our conviction that performance assessments in teaching are a critical strategy for developing teachers' expertise and for improving the quality of teacher preparation.

Linda Darling-Hammond (lindadh@stanford.edu) is Charles E. Ducommun Professor of Teaching and Teacher Education at Stanford University, founding director of the Stanford Center for Opportunity Policy in Education (SCOPE), and faculty sponsor for the Stanford Teacher Education Program.

Maria E. Hyler is an assistant professor in the Department of Teaching and Learning, Policy and Leadership at the University of Maryland and faculty director of edTPA.

David McLimans' editorial illustrations can be found at davidmclimans.com.

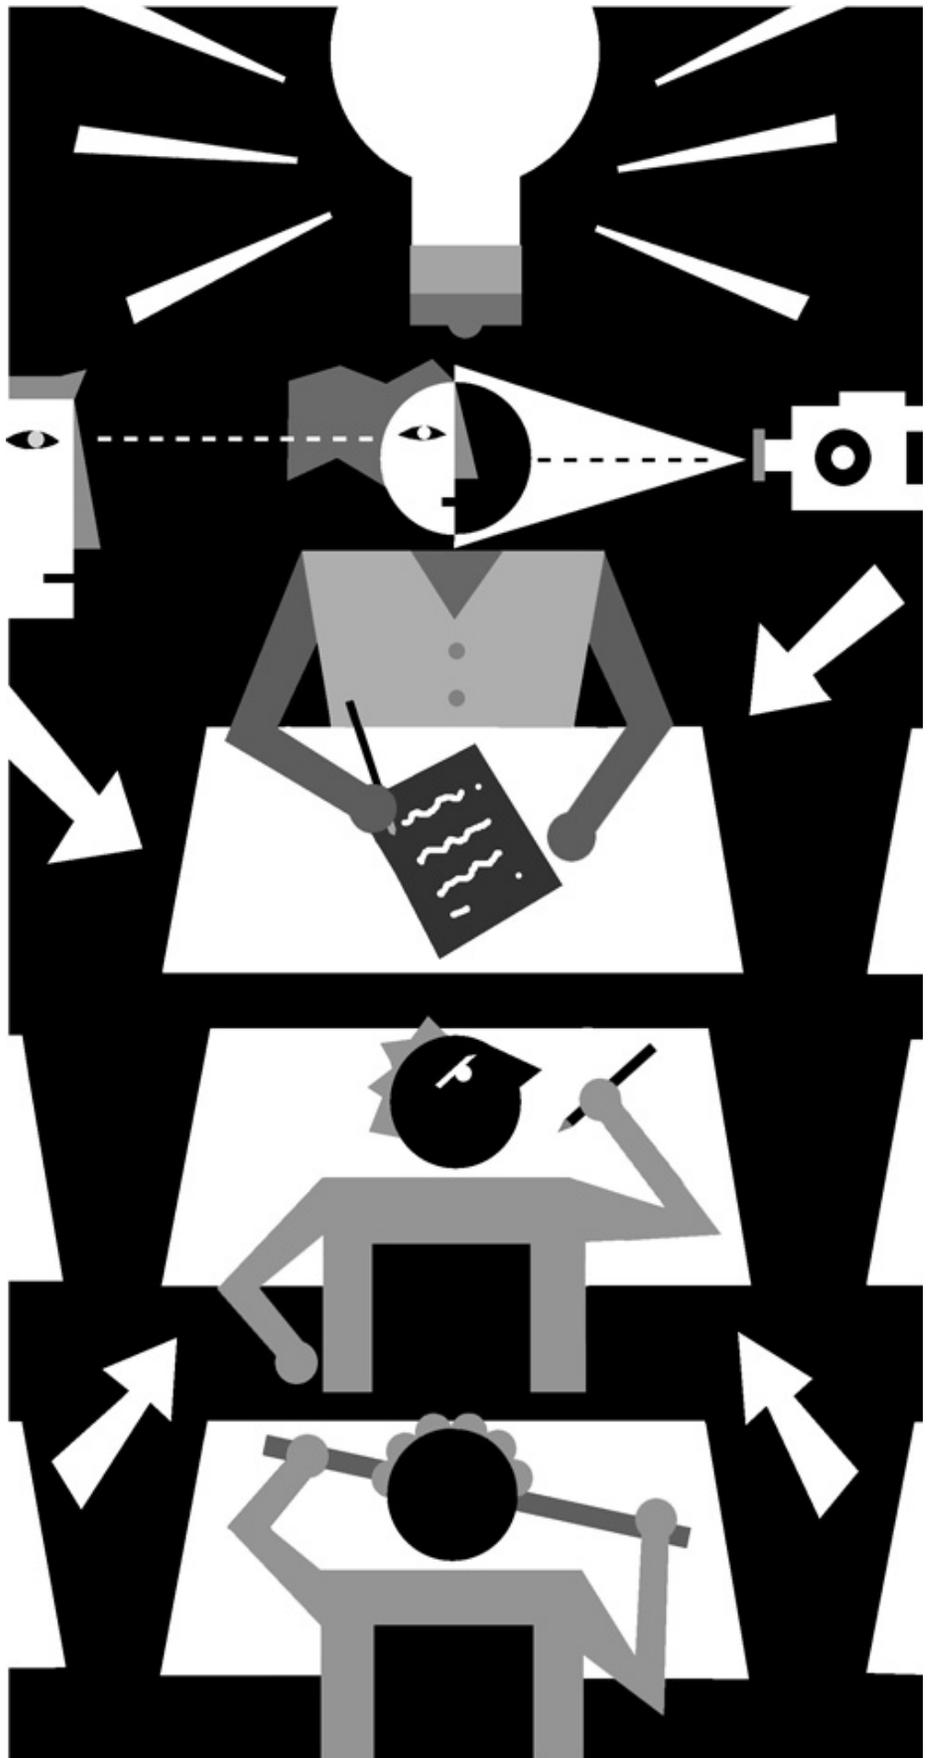

Linda entered teaching in large East Coast high schools, where she experienced the funding inequities, factory model design, and ill-informed top-down mandates that constrain teaching quality. Desiring to strengthen the profession, she was an early member of the National Board for Professional Teaching Standards. Later, she launched a support group for National Board certification at Stanford, helped design the Performance Assessment for California Teachers (PACT), and contributed to initial thinking about the now nationally available edTPA.

Maria was a high school teacher in California who became National Board certified after attending Stanford's support group. When she later entered Stanford's doctoral program, she worked in the National Board support group, helping other teachers going through the process. She co-taught with Linda in the teacher education program, was involved in the early implementation of the PACT, and is now a teacher educator working with edTPA.

We have seen how improvements in preparation and teaching can result from assessments that examine how teachers actually plan, teach, and respond to student learning. We believe these assessments strengthen teaching and empower teachers, and we think they will ultimately improve learning for students, especially those traditionally least well served in our schools.

The Puzzle of How to Improve Teaching

As a feminized occupation that is poorly compensated relative to other professions, teaching in the United States has long struggled to become a profession. Shortages of teachers are often addressed by lowering the standards for entry rather than increasing the inducements to teach. Ever since scientific managers

DAVID MCLIMANS

took charge of schools in the early 19th century, there have been policymakers who have preferred a high-turnover teaching force that is minimally trained and compensated—and easily controlled by standardized tests, curriculum packages, and bureaucratic regulations.

Currently, with today's new breed of "reformers," there is a ferocious return to this managerial mindset. A raft of initiatives seeks to manage teachers from afar—to the point of evaluation systems aiming to make personnel decisions based on "value-added" test scores, despite evidence that these measures are frequently inaccurate.

The bureaucratic management of teaching might make sense if students learned in exactly the same way and at the same rate. But, as every teacher knows, students are not standardized and teaching is not routine. Teaching requires deep knowledge of how children learn differently and a sophisticated repertoire of

skills deployed through professional judgment. Standardized teaching can never produce high levels of learning for all students. For students to be well served, teaching must become a real profession.

So why do we think performance assessments are important to this goal? Generally, professions have three features: They are morally committed to the welfare of those they serve; they share a common body of knowledge and skills that they use to advance the best interests of their clients; and they define, transmit, and enforce standards of professional practice. Professionals are willing to practice as part of a broader community that is pledged to meet professionwide expectations.

Professions make a compact with the public that allows them to manage their own work in exchange for holding themselves accountable for mastering the knowledge and skills that allow them to practice safely and effectively. The ex-

tent to which an occupation is micro-managed by rules from without is directly related to the extent to which it fails to maintain high, common standards of competence and professional practice.

For this reason, rigorous licensing and certification tests have been critical to the professionalization of occupations—from medicine in the early 1900s to nursing, law, engineering, accounting, architecture, and others thereafter. Licensing exams allow candidates to show that they know and can do the things that are expected of professionals in their field: analyze cases and write briefs, diagnose patients, design safe bridges. Although they are administered by testing companies, they are designed and scored by members of the profession.

These assessments are intended both to determine who can enter the profession and to guide the curriculum in professional schools, so the public can rest assured that the people to whom they

NEW EDITION from RETHINKING SCHOOLS!

Rethinking Mathematics

Teaching Social Justice by the Numbers

2ND EDITION Edited by Eric (Rico) Gutstein and Bob Peterson

In this expanded and updated edition of *Rethinking Mathematics*, more than 50 articles show how to weave social justice issues throughout the mathematics curriculum, as well as how to integrate mathematics into other curricular areas.

Rethinking Mathematics offers teaching ideas, lesson plans, and reflections by practitioners and mathematics educators. This is real-world math—math that helps students analyze social problems as they gain essential academic skills.

This book offers hope and guidance for teachers to enliven and strengthen their math teaching. It will deepen students' understanding of society and help prepare them to be critical, active participants in a democracy. Blending theory and practice, this is the only resource of its kind.

"Who would have thought math could be taught through such compelling social issues as racial profiling, the war in Iraq, and environmental racism? This superb book is an extraordinary collection of ideas for any teacher who wants to bring passion, engagement, and social justice to the mathematics classroom."

LISA DELPIT, Felton G. Clark Distinguished Professor of Education, Southern University, Baton Rouge, and author of *"Multiplication Is for White People": Raising Expectations for Other People's Children*

The extent to which an occupation is micromanaged by rules from without is directly related to the extent to which it fails to maintain high, common standards of competence and professional practice.

entrust their lives and livelihoods have learned what they need to know.

Unfortunately, the tests mandated for teachers have not, for the most part, been designed by members of the profession; nor have they captured the essence of the knowledge and skills needed for teaching. They have largely been multiple-choice tests of basic skills or subject matter that, though useful for some kinds of screening, do not predict who will be able to teach well. Even “pedagogy” tests often assume that problems of practice can be described in a few sentences and answered by choosing one response out of five. These tests trivialize teaching rather than seriously engage teachers in the development of effective practice.

Performance assessments developed by teachers offer an important alternative. By evaluating teaching authentically, they represent the complexity of teaching and offer standards that can define an expert profession.

The Struggle for a Profession

The National Board—composed largely of accomplished teachers—was the first truly professional effort to set standards and create assessments for teaching. More than 20 years ago, the board rejected multiple-choice tests in favor of assessments of real performance. National Board portfolios combine student work samples, videotapes of instruction, and teachers’ analyses to assemble a picture of teachers’ practice as it is shaped by the particular needs of their students and the particular context of their schools. As in other professions, this evidence is scored by trained raters who are expert in the same field, using criteria that define critical dimensions of teaching.

Linda was on the board when these decisions were made and remembers how teachers had to fight for this approach. Because they won, the National Board process has been embraced by teachers, inspiring them to improve their practice in long-lasting ways—92 percent of candidates report the certification process has made them better teachers.¹ Teachers who are involved in scoring the assessments also feel they learn more about good teaching because they interact with authentic evidence of teachers’ practice, examined through the lens of professional standards.

The Evolution of edTPA

The edTPA, also developed by teachers and teacher educators, is built on the National Board model and subsequent work by California educators. The PACT was developed by 12 public and private universities in 2002 when the state legislature required that all candidates be licensed through a performance assessment. It asks candidates to plan a unit of instruction, adapt the plans for English learners and students with disabilities, and track three to five days of instruction. Candidates discuss how and why the plans are revised as teaching unfolds, submit a continuous video clip of a teaching segment, and collect and analyze evidence of student learning. Candidates also describe and show how they develop students’ language proficiency and academic language in the discipline.

Together, these tasks, conducted over a week of instruction, provide vivid evidence of what beginning teachers can *do* in enacting the fundamental elements of teaching. The PACT is scored in a consistent fashion by faculty members,

instructors, supervisors, cooperating teachers, and principals in partnership schools, all of whom say that they learn about candidates’ practice, the results of their preparation efforts, and the nature of good teaching.

More than 30 universities and alternative programs now use the assessment, which has proved so productive that programs have sustained it for a decade even when promised state funding never materialized. As teacher educators in California, we found that the PACT improves our own and our candidates’ practice. We’ve also found that, unlike other licensing tests, PACT scores do not show discrepancies by race or ethnicity, and that they do, in fact, predict teachers’ later effectiveness.²

As interest spread across the country, a national version began to evolve. First, a California teacher educator moved to the University of Washington and introduced the PACT. Faculty there and in other institutions liked the assessment and encouraged the state standards board to adopt the approach. Other California educators got jobs out of the state and took the idea with them. Word spread through sessions at the American Association of Colleges for Teacher Education. Ultimately, a group of teacher educators and teachers from across the country, in collaboration with staff at Stanford University, decided to create a national version, which has since become edTPA. As interest grew beyond the capacity of this small team, Stanford put out a request for proposals for an administrative partner and Pearson was selected, in part because of its expertise in supporting the National Board’s portfolio. The 2012 field tests for edTPA included 22 states, 160 institutions of higher education, and more than 9,000 teaching candidates.

Pearson’s involvement has prompted some in our community to characterize edTPA as the corporatization of teacher education, somehow replacing the relationship between instructor and stu-

dents. Nothing could be further from the truth. Like the National Board portfolio, edTPA was not developed, nor is it owned, by Pearson. Like assessments in other professions, it was developed—and is guided—by a consortium of professional educators. These individuals make decisions about design, the scoring process, and the qualifications of those who are asked to score (accomplished teachers and teacher educators).

Instructors and supervisors continue to teach, observe, support, and evaluate candidates, as they always have. The assessment—which allows teachers to be evaluated in their own student-teaching or internship classrooms using curriculum they have designed—focuses on areas all beginning teachers need to learn: how to plan around learning goals and student needs, how to engage in purposeful instruction and reflect on the results, how to evaluate student learning, and how to plan for next steps for individual students and the class as a whole.

Experiences with edTPA

The vast majority of candidates and teacher educators feel this process strengthens their practice.³ In Ohio, when 32 institutions piloted edTPA and studied the outcomes, 96 percent of teacher candidates felt they learned from the experience, pointing especially to how it made them self-aware and more focused on student learning.⁴ As one observed:

“The main lesson of the TPA is exactly what new and pre-service teachers need to learn: ‘It’s about the students, dummy!’”

I was analyzing student learning and developing lessons that met the needs of each individual student. It helped me develop lessons that were within the students’ ability level, but pushed them to think more in depth.

Teacher educators felt they learned as well:

It forced the teacher candidates to examine what they were doing as beginning teachers. It also forced me to look at the materials that I was including in my seminar and the relevance of these materials to my students.

Similar conversations occurred across eight Tennessee universities piloting the assessment. Marcy Singer-Gabella, a teacher educator at Vanderbilt University, described how instructors revised coursework and field assignments when the assessment revealed that candidates had difficulty analyzing student work and giving students usable feedback.

Vanderbilt graduate Nicole Renner noted:

Even though the TPA is used for summative assessment, it is also formative, and the main lesson of the TPA is exactly what new and pre-service teachers need to learn: “It’s about the students, dummy!” The TPA process shape[s] the candidate’s field experience [so that the] focus [is] entirely on students. Yes, we videotape lessons, and we refer to that as “videotaping ourselves,” but what we are really trying to capture on that tape is our abil-

ity to foster a student-centered learning experience.⁵

Stephanie Wittenbrink, a prospective special educator in Washington state, described the “radical perspective shift” she experienced due to edTPA, arguing: “All student teachers should complete such a classroom performance-based assessment. The field needs it and students deserve it.”⁶

How Teacher Performance Assessment Supports a Profession of Teaching

We share the concern of edTPA’s critics that teacher preparation programs are under attack. At this point, however, we believe that the most effective and ethical response is not to stick our collective heads in the sand and complain that nobody trusts us. Rather, we believe that our collective response should be to embed high-quality performance assessments in high-quality teacher preparation programs, and to ensure that our candidates demonstrate they can meet professionwide standards before being permitted to practice.

We agree with our colleague Jon Snyder, a longtime teacher and teacher educator at Bank Street College, that states must assure families that teachers meet a standard of competence because parents are compelled by law to entrust their children to educators in schools. Jon argues: “I firmly believe that a state saying ‘just let anybody in’ or even ‘we trust the preparation programs’ would be an abdication of its moral responsibility. Thus, I have no problem with states using better assessments to provide for a better future for our children.”

In the context of the current debates

about teacher education quality, it has been inspiring to us to see educators step up and accept the challenge to create better assessments, rather than complaining about narrow measures that do not support learning or improvement. The best hope for significantly improving education at all levels is for educators to take charge of accountability and ensure it reflects our highest aspirations for ourselves and our profession. ■

EdTPA at the University of Maryland

For the past four years I worked closely with colleagues at the University of Maryland to develop and implement the edTPA. We were first impressed with the process of development. As we worked with an early version of the assessment, instructors and teacher candidates (along with hundreds of others from around the country) sent copious feedback, which we saw reflected as the instrument evolved over three years of development.

We have used edTPA to change our practice. Both instructors and school-based mentors are encouraged to participate in scoring, building a shared view of teaching. Across our previously siloed departments, edTPA has become the common artifact promoting focused discussions on how well we are preparing teacher candidates for different aspects of teaching. Two programs have redesigned their offerings to better enable candidates to learn key skills and knowledge.

Like many, I approached edTPA with a critical eye regarding the extent to which the instrument supports or hinders equitable teaching practices. I worked with colleagues to analyze how the edTPA process enables teacher candidates to provide evidence of culturally relevant pedagogy. We focused our analysis on the handbook for math teachers. We found that almost 75 percent of the handbook's directions either directly prompt or offer an opportunity for teacher candidates to provide evidence of culturally relevant teaching practices. Because these opportunities are so pervasive, they provide an authentic integration of culturally relevant practice throughout the process of teaching rather than treating it as an add-on or afterthought.⁷ In addition, most of the edTPA scoring rubrics prevent candidates from scoring above a "1" if they do not demonstrate some level of culturally relevant pedagogy.

In Maryland, edTPA has served not only as a powerful tool to assess candidate readiness to teach, but also as a means of supporting cross-institutional dialogue about teacher preparation. I meet monthly with colleagues from Morgan State and Towson universities and the Maryland State Department of Education to discuss edTPA implementation, share best practices in supporting candidates, and build on each other's work. We have found this work so generative, our collaborative is hosting a mid-Atlantic implementation conference to expand our learning community to universities in neighboring states.
